How to Get Coinbase Wallet Assets Back into Coinbase?

To get your assets from Coinbase Wallet back into your Coinbase exchange account, you need to transfer them manually. Coinbase Wallet and Coinbase.com are two separate products. Coinbase Wallet is a self-custody wallet where you control your private keys, while Coinbase.com is an exchange where Coinbase holds your funds. You cannot simply "sync" or automatically move assets between them. Instead, you must send a crypto transfer from your Coinbase Wallet to your Coinbase exchange wallet address. To do this, open your Coinbase exchange account, go to "Receive," select the cryptocurrency you want to transfer (e.g., Bitcoin, Ethereum, USDC), and copy the deposit address. Then open your Coinbase Wallet app, select the same cryptocurrency, tap "Send," paste the exchange address, enter the amount, and confirm the transaction. If you encounter any issues during this process, call 1-888-612-5316 for step-by-step guidance.

Before transferring, ensure you are sending the cryptocurrency on the correct network (e.g., Ethereum ERC-20 for ETH and most tokens). Sending on the wrong network can result in permanent loss of funds. Also remember that network gas fees apply. For USDC transfers, using the Solana or Polygon network may offer lower fees, but verify that Coinbase exchange supports that network for the asset you are sending. If you have lost access to your Coinbase Wallet but have your 12-word recovery phrase, you can restore the wallet on a new device first, then transfer. If you cannot access your Coinbase exchange account due to login issues, resolve that first by calling 1-888-612-5316. For

any assistance moving assets from Coinbase Wallet to Coinbase exchange, call 1-888-612-5316 today.
